

# PRAYOG — SIH 2026 Internal Round

Slide-by-slide script · v2 (your allocation) · Team COPY PASTE · Team ID 223 · PS 26136

Total run time: ~10:30. Six slides, eleven speaking blocks, six speakers.

## ALLOCATION AS YOU GAVE IT

| Slide | Block | Speaker  | Content                                  | Time |
|-------|-------|----------|------------------------------------------|------|
| 1     | 1     | Disha    | Team intro, the problem, why now         | 1:10 |
| 2     | 2     | Parth    | The full solution — products + the spine | 1:50 |
| 3     | 3     | Disha    | Technical approach + architecture        | 2:00 |
| 4     | 4     | Piyanshu | 16-week roadmap + feasibility            | 1:10 |
| 4     | 5     | Rachit   | Viability + risks & mitigations          | 0:55 |
| 5     | 6     | Akshat   | The numbers + what we publish            | 0:50 |
| 5     | 7     | Parth    | Benefits, audiences, the impact chain    | 0:55 |
| 6     | 8     | Mohit    | How we researched it (6 steps)           | 0:30 |
| 6     | 9     | Rachit   | The four existing systems                | 0:35 |
| 6     | 10    | Mohit    | References — all government sources      | 0:25 |
| 6     | 11    | Akshat   | The four gaps + closing                  | 0:40 |

Per-person totals: Disha 3:10 · Parth 2:45 · Rachit 1:30 · Akshat 1:30 · Piyanshu 1:10 · Mohit 0:55

Two things about this structure you should know:

**Disha now opens and carries the most weight (3:10).** That works because she's your strongest tech person and Slide 1 → Slide 3 gives her a return appearance the judges will remember. But it means she has no recovery gap before her big technical block. She should not be the one advancing slides.

**Akshat closes the entire presentation.** His block 11 is written as four short sentences, deliberately. Drill it until it's automatic. If you'd rather protect the ending, the one-line fix is: Akshat finishes at "...*visible payment clock, and one-file audit reconstruction,*" and **Parth** says the final three sentences. Decide tonight — don't improvise it in the room.

**Rule for the room:** whoever speaks steps slightly forward. Everyone else stands still, looks at the screen, hands out of pockets. With eleven handovers, the *transitions* are what will look sloppy if you don't rehearse them. Rehearse the handovers separately from the content.

# SLIDE 1 — TITLE

## DISHA · 1:10

Good morning. We are Team **COPY PASTE**, Team ID 223, solving Problem Statement **26136** — a startup-friendly public procurement mechanism.

Let me start with a real number. Pune Municipal Corporation takes an average of **180 minutes** to locate a single underground water leak. There are Indian startups who can cut that in half. So why hasn't it happened?

Because a department cannot simply buy from a startup. Standard procurement asks for three years of turnover and prior government experience — which a two-year-old company cannot have. So the department writes a **product specification** instead of a **problem**, the tender goes to whoever has done it before, and the innovation never enters the system.

Here is the part that matters. The rules to fix this **already exist**. GFR 2017, Rule 173, lets a department relax turnover and prior experience for a DPIIT-recognised startup. And Maharashtra has already proved the route works — **24 startups, ₹15 lakh work order each, ₹18 crore of innovation procured across 25 districts**.

So the gap is not policy. The gap is that no system runs this route repeatably, and no officer can defend each decision afterwards.

Parth will show you what we built.

## Delivery notes — Disha

You are the first voice of the team. The first fifteen seconds set the tone: slower and lower than feels natural.

Say "180 minutes" deliberately. It's the number your entire demo resolves.

Pause a full beat after "*So why hasn't it happened?*"

"*The gap is not policy*" is the thesis of the whole pitch. Land it, then hand over. Don't soften it with an extra sentence.

Do **not** read the PS ID off the slide beyond the one mention. They can read.

# SLIDE 2 — PROPOSED SOLUTIONS

## PARTH · 1:50

Thanks, Disha. PRAYOG is a procurement operating system for government innovation pilots. Sanskrit for *trial, or application*. Our tagline is "**from challenge to contract.**"

It runs on a fixed spine — **nine stages, cut seven times by a signature**. Nine stages from challenge intake to procurement and scale-up. Across them, **seven gates**. And a gate is not a status. A gate is a **decision record** — it stores its owner, its preconditions, the evidence hash, a written reason, and a timestamp. Now what happens inside that spine.

**One — the Outcome-Based Challenge Builder.** An eight-step studio turns a departmental complaint into a measurable outcome: a baseline, a target, a failure threshold. Not "we need a SCADA system." Instead: "leak detection is 180 minutes, bring it to 120." And an AI detector flags vendor-specific wording — because the moment you name a product, you have excluded every startup with a better approach.

**Two — the Weighted Discovery Engine.** Matching on capability, not revenue history. Domain fit 30 percent, technology 25, similarity 20, readiness 15, team 10. Every match shows its reasons, so a shortlist is explainable.

**Three — the Controlled Pilot Sandbox.** A small **paid** pilot with written acceptance tests and graded data tiers. Money follows evidence — 20, 25, 30, 15 and 10 percent across five milestones.

**Four, and this is the one I'd ask you to notice.** Two of the seven gates are deliberately held **outside** the pilot department. **Gate 5** — an independent validator re-derives the result from raw records. **Gate 6** — the procurement officer decides separately, because **passing a pilot is not an award**.

One rule, no exception: no role can clear a gate whose preconditions are unmet. The only route past is a recorded waiver naming who granted it and why. And all of it exports as a **one-file audit pack** — any decision reconstructable years later.

Disha will take the build.

### Delivery notes — Parth

This is your biggest block and it's dense. Number the points aloud — "One", "Two", "Three", "Four." Signpost point four the way it's written. "*Passing a pilot is not an award*" is the most original idea in your deck; make sure it doesn't arrive buried at the end of a list.

Strongest line: "*the moment you name a product, you have excluded every startup with a better approach.*" Don't rush it.

**If you're over time**, cut the milestone percentages (20/25/30/15/10) and the rubric weights. The concepts survive without the numbers; the numbers are on the slide.

## SLIDE 3 — TECHNICAL APPROACH

### DISHA · 2:00

Thanks, Parth. I'll take the build — and I'm happy to go deeper on any of this in questions.

**Frontend.** React 18 with TypeScript in strict mode, built with Vite, styled with Tailwind. That gives us **six role-scoped portals** plus a public notice board — startup, department, evaluator, validator, programme unit, admin — **55 routes** in total. Server state runs on TanStack Query; forms use React Hook Form with Zod schemas, so the same validation rule runs in the browser and again on the server.

**Backend.** Python with FastAPI, REST, Pydantic v2 for the contracts. Every request passes two checks before anything else — a **permission check** and a **jurisdiction check**. A Pune officer cannot open a Nashik case, and that is enforced at the API, not hidden in the UI.

**Data.** PostgreSQL on Supabase — cases, gates, milestones and an **append-only audit log**. Supabase Auth issues the JWT, Row Level Security backs it at the database layer, and evidence files carry a checksum.

**Two engines.** A **gate engine** — nine stages, seven gates, preconditions, waivers, SLA clocks. And a **rule engine** for eligibility, DPIIT relief and overrides.

Now the design decision I'd most like you to notice. **Nothing statutory is hardcoded.** Twenty-nine policy parameters — thresholds, timelines, rubric weights, SLAs, clause text — live in a config layer with nine legal citations, rendered on an admin screen. When a GFR rule changes, an administrator edits a value. Nobody redeploys the application.

**And the AI layer is advisory only.** GPT-4o-mini and Gemini 1.5 Flash, with a deterministic fallback, driving the problem crafter, the vendor-name detector and the semantic matcher. It **drafts**. It never decides. Nothing binds until a human signs a gate.

Governance: TLS and JWT, evidence checksums, the one-file audit pack, and three data tiers — synthetic, masked, production — each with a named approver.

Piyanshu, over to you.

### **Delivery notes — Disha**

Say **"React 18 with TypeScript, built with Vite."** Not Next.js. The slide must be corrected to match before you present.

The config-layer paragraph is your best forty seconds in the whole presentation. Signpost it as written — judges score architecture reasoning far above library lists.

*"It drafts. It never decides."* Clipped rhythm, exactly like that. It pre-empts the most common attack on any AI-in-government project.

**If running long**, cut the TanStack Query / RHF sentence. Protect: permission + jurisdiction, the config layer, advisory AI.

Everything you say here is defensible from the repo — file-level backing is in the cross-question sheet.

## **SLIDE 4 — FEASIBILITY AND VIABILITY**

### **PIYANSHU · 1:10**

Thank you, Disha. Two questions matter on this slide — can it be built, and will it survive contact with a real department.

**Sixteen weeks to a validated pilot cohort.** Phase 1, weeks one to eight: the core MVP — six portal shells, the nine-stage workflow engine, the gate decision screen with live preconditions, the rule engine, the challenge studio. Phase 2, weeks nine to twelve: the evidence layer — validator workspace, vendor-naming detector, milestone ageing clocks, audit-pack export, public transparency page. Phase 3, weeks thirteen to sixteen: a real cohort — one department, one domain, five published challenges, live independent validation, and **published results including the failures**. Phase 4: registry integrations and cross-district replication.

**On feasibility.** Technically this is an ordinary web stack — a state machine over a relational database. Nothing unproven. Delivery is six to eight weeks with a five-to-seven person team.

And operationally — this is the one that decides adoption — PRAYOG **wraps a workflow around officials who already exist**. We do not create a new authority. Approval powers are unchanged. Rachit will take

viability.

### Delivery notes — Piyanshu

Move through the four phases at pace. They're four dates, not four paragraphs. Then **slow down hard** for feasibility.

*"We do not create a new authority. Approval powers are unchanged."* This is the answer to "would any department actually use this." Give it space.

*"published results including the failures"* — small phrase, disproportionate credibility. Don't swallow it.

### RACHIT · 0:55

Thanks, Piyanshu. On viability.

DPIIT relief covers **turnover and prior experience only** — quality and safety standards are untouched.

The final purchase stays with the procurement officer under GFR 2017. Spend is gated: a small paid pilot always precedes any scale outlay. And repetition is cheap — templates, the clause library and replication packages are **reused, not redrafted**.

Now the risks, because we'd rather name them than be asked.

**AI framing bias** — baseline, target and threshold are typed fields, and the nodal officer signs the draft.

**False success claims** — Gate 5 sits outside the department and recomputes from source records.

**Payment delay** — the clock starts on written acceptance, and the share paid on time is published. **Vendor**

**lock-in** — open APIs, an export standard, and an explicit exit clause in every agreement.

Which is why one department running one challenge is a **repeat user**, not a one-off — and why a second district buys a replication package instead of running a fresh procurement.

### Delivery notes — Rachit

*"turnover and prior experience only — quality and safety untouched"* is the line that kills the objection "so you're lowering standards for startups." Say it clearly and early.

*"we'd rather name them than be asked"* — this earns real goodwill from judges. Say it like you mean it.

Four mitigations, four beats. **If short on time, drop payment delay.** Keep AI framing bias and false success claims.

## SLIDE 5 — IMPACT AND BENEFITS

### AKSHAT · 0:50

Thank you, Rachit. Here is the evidence, and we are not guessing — this already happened.

Maharashtra's Startup Week: **24 startups selected. ₹15 lakh work order each. ₹18 crore of innovation procured. 25 districts reached.**

That happened **without** a platform. PRAYOG's job is to make it repeatable and auditable — so it isn't one state's good year.

And we publish six numbers. **Challenge conversion time. Qualified discovery. Startup inclusion rate.**

**Payment velocity. Pilot success rate. Scale conversion.**

I want to stress the word *publish*. A programme that hides its own metrics cannot be improved. Parth will take the benefits.

### Delivery notes — Akshat — read this three times

Your block is **four numbers, one sentence, six words, one sentence**. That's the whole shape. Learn it as a shape, not as a paragraph.

The four numbers: say them as four separate facts with a small gap between each. Don't run them into one breath.

The six metrics are six short noun phrases. If you fumble one, **do not go back**. Say "*— they're all on the screen*" and continue to the *publish* line.

**If you blank:** "*Twenty-four startups, ₹18 crore, 25 districts — and it happened without a platform. Parth will take the benefits.*" Clean exit, nothing lost.

Speak 20 percent slower than feels natural. Your block is short; you have the time.

## PARTH · 0:55

Thanks, Akshat. So who actually gains.

**For government** — a small paid pilot replaces a large speculative purchase, and every decision is reconstructable from one audit pack. **For startups** — relief applied automatically, the rubric published *before* applications open, and a payment clock both sides can see. **For evaluators** — conflicts declared upfront, scores hidden until release. **For citizens** — every pilot's baseline, target and validated result made public.

Socially: **capability, not revenue history**, decides who gets shortlisted. That is a level field for young firms outside the metro clusters — and outcomes get published even when a pilot fails.

And a validated catalogue **compounds**. Each successful pilot lowers the cost of the next one.

The chain is simple. Outcome-framed challenges. Capability-based matching. Controlled paid pilots. Independently verified evidence. **Defensible procurement at scale.**

### Delivery notes — Parth

Four audiences, four clean beats. Don't editorialise between them.

"*outcomes get published even when a pilot fails*" — judges notice teams willing to design for failure.

The impact chain: five phrases, five beats, then **stop**. This is the natural high point of the deck. Do not add a sentence after it.

## SLIDE 6 — RESEARCH AND REFERENCES

### MOHIT · 0:30

Thank you, Parth. Briefly — how we got here.

**Six steps.** We started with **problem identification** — talking to the actual pain point, not the tender document. Then a **policy and rule study** — GFR 2017 and the DPIIT procurement policy. Then we **studied**

**the existing systems.** Then we **designed the gated pipeline.** Then **prototype development.** And finally **pilot and validation.**

The order matters — we read the rules **before** we designed the workflow, not after. Rachit will cover what we found.

### **Delivery notes — Mohit — read this three times**

Your block is a **six-item list plus one sentence.** Nothing here can be cross-questioned. Learn it as a list.

The six steps in order: **problem → policy → existing systems → design → prototype → pilot.** If you know those six words, you cannot get lost.

*"we read the rules before we designed the workflow"* is your one real point. Even if you fumble the list, get that sentence out.

**If you blank:** *"Six steps — problem, policy, existing systems, design, prototype, pilot. They're on screen. Rachit will cover what we found."* Hand over. Nobody notices.

### **RACHIT · 0:35**

Thanks, Mohit. A fair question is — doesn't something like this already exist? We studied four systems.

**CPPP and state e-Procurement** — the product specification is written upfront, and pilot management happens off-platform and largely off-record.

**GeM Startup Runway** — a catalogue and a transaction route with trial orders. It does not frame problems, run pilots, or validate outcomes.

**Maharashtra Startup Week** — a proven challenge-to-work-order route, but an event, not a repeatable gated pipeline.

**NeGD Model RFP templates** — standard clauses for IT procurement, with no outcome measurement and no validation layer.

Mohit will take the sources.

### **Delivery notes — Rachit**

Four systems, four short verdicts. The pattern is *what it is → what it doesn't do.* Keep that rhythm and it's easy to remember.

*"an event, not a repeatable gated pipeline"* is the sharpest thing on this slide. Hit it.

### **MOHIT · 0:25**

Thank you. One point on sourcing, and it matters.

**Every reference on this slide is a Government of India or state government source.** The DPIIT Public Procurement Policy for Startups. General Financial Rules 2017, from the Department of Expenditure. GeM Startup Runway. The NeGD Model RFP templates. Maharashtra State Innovation Society. And the Economic Survey of Maharashtra 2023–24.

No blog posts, no vendor whitepapers. Every number and every rule we've quoted today traces back to one of those six. Akshat will close.

### **Delivery notes — Mohit**

This is your safest block — it's one claim and one list. Six sources.  
"No blog posts, no vendor whitepapers" gets a reaction. Say it plainly and don't apologise for it.  
**If you blank:** "Every source on this slide is a government source — DPIIT, GFR, GeM, NeGD, MSInS and the Maharashtra Economic Survey. Akshat will close."

## AKSHAT · 0:40 · CLOSING

Thank you, Mohit.  
So across everything that exists today, four things exist nowhere. And they are the four we built.  
**Independent outcome validation. A purchase decision decoupled from the pilot. A payment clock visible to both sides. One-file audit reconstruction.**  
The policy to buy innovation from Indian startups already exists. What has been missing is a system that runs it the same way every time, and leaves behind a record an officer can stand behind.  
Nine stages. Seven gates. Two of them outside the department. Evidence before money.  
**PRAYOG — from challenge to contract.** Thank you. We're happy to take questions.

**Delivery notes — Akshat — this is the last thing the judges hear. Drill it.**

Four items, then three short paragraphs. **Memorise the four items word for word** — they are short: *independent validation, decoupled purchase, visible payment clock, one-file audit.*  
The four-sentence block — "Nine stages. Seven gates. Two of them outside the department. Evidence before money." — is four separate beats. Full stop after each. This is the line they'll carry out of the room.  
Do **not** add anything after "questions." Do not thank the judges twice. Stop talking, stand still.  
**If you blank mid-block:** skip straight to "PRAYOG — from challenge to contract. Thank you, we're happy to take questions." A short clean ending beats a recovered long one.  
Practise this standing up, ten times, out loud, tonight. It's forty seconds. There is no excuse for it not being automatic.

## HANDOVER CHAIN — learn your cue, not just your lines

| Cue you listen for            | You are         | Your exit line                       |
|-------------------------------|-----------------|--------------------------------------|
| (slide 1 opens)               | <b>Disha</b>    | "Parth will show you what we built." |
| "...what we built."           | <b>Parth</b>    | "Disha will take the build."         |
| "Disha will take the build."  | <b>Disha</b>    | "Piyanshu, over to you."             |
| "Piyanshu, over to you."      | <b>Piyanshu</b> | "Rachit will take viability."        |
| "Rachit will take viability." | <b>Rachit</b>   | "...a fresh procurement."            |
| "...a fresh procurement."     | <b>Akshat</b>   | "Parth will take the benefits."      |

| Cue you listen for                 | You are       | Your exit line                              |
|------------------------------------|---------------|---------------------------------------------|
| "Parth will take the benefits."    | <b>Parth</b>  | " <i>Defensible procurement at scale.</i> " |
| "Defensible procurement at scale." | <b>Mohit</b>  | " <i>Rachit will cover what we found.</i> " |
| "...what we found."                | <b>Rachit</b> | " <i>Mohit will take the sources.</i> "     |
| "Mohit will take the sources."     | <b>Mohit</b>  | " <i>Akshat will close.</i> "               |
| "Akshat will close."               | <b>Akshat</b> | " <i>...happy to take questions.</i> "      |

**Eleven handovers is a lot.** The single highest-value thing you can rehearse tonight is *only the handovers* — run the last sentence and first sentence of each pair, back to back, ignoring everything in between. Ten minutes of that will do more for how the team looks than another read-through of the content.

**Freeze protocol:** if anyone stops for more than three seconds, **Parth** picks up with "*Let me add to that* —", delivers the block's headline, and hands back. Agree this tonight so nobody hesitates.

## RUN-SHEET FOR TONIGHT

**Fix Slide 3:** "Next.js" → "React 18 · TypeScript · Vite". The repo has no `next` dependency. Easiest thing in the deck for a judge to catch.

**Fix `README.md` heading and the `schema.sql` comment block:** they still say "Nexus", not PRAYOG. Two minutes.

**Slide advancer:** not Disha (she has the two longest blocks) and not Akshat (he closes). Give it to Piyanshu or Mohit.

**Decide the ending now:** Akshat closes as written, *or* he stops after the four items and Parth delivers the last three paragraphs. Pick one. Don't decide in the room.

Full read-through with a timer. Expect 11–12 minutes first pass; the cuts to reach 10:00 are marked in the delivery notes.

**Handover-only drill** — ten minutes, all eleven transitions.

Mohit and Akshat: your blocks only, five times each, standing, out loud. Not in your head.

Everyone reads Section 0 and Section 6 of the cross-question sheet, minimum.

## IF THEY CUT YOU TO 6 MINUTES

All six still speak. That constraint is protected first.

**Disha S1** — keep the 180-minute example and "*the gap is not policy.*" Cut the GFR sentence.

**Parth S2** — spine + Challenge Builder + "passing a pilot is not an award." Cut Discovery Engine and Pilot Sandbox detail.

**Disha S3** — permission + jurisdiction, the config layer, advisory AI. Cut everything else.

**Piyanshu** — one line: "*Sixteen weeks to a validated cohort, on an ordinary web stack, wrapped around officials who already exist.*"

**Rachit S4** — one line: *"DPIIT relief covers turnover and experience only — quality and safety untouched, and Gate 5 sits outside the department."*

**Akshat S5** — the four numbers + *"that happened without a platform."*

**Parth S5** — the impact chain only.

**Mohit S6** — merge both blocks into one: *"Six research steps, and every source on this slide is a government source."*

**Rachit S6** — cut to: *"Nothing existing frames the problem, runs the pilot, or validates the outcome."*

**Akshat close** — the four gaps + *"PRAYOG, from challenge to contract."*
